

H5: cross-cohort C-index stability — FI vs Intrinsic Capacity (supplementary analysis)

Hollow circle = CHARLS apparent C-index (development set). Solid circle = CLHLS external C-index (validation set). Arrow direction indicates the direction of change in C-index. |Delta C| = absolute cross-cohort change in C-index. Model B (FI): |Delta C| = 0.052 vs Model C (IC): |Delta C| = 0.095 → H5 supported. IMPORTANT CAVEAT: CLHLS IC (Model C/D) used binary FI items as proxies for continuous measurements (grip strength, gait speed). Full H5 test with continuous IC measurements is deferred to Paper 2 (D-012). Bootstrap 95% CI for CLHLS C-indices did not cross null.
